

BI Case Study Notes

Case Study 1: Netflix (Entertainment Industry)

Netflix uses Business Intelligence to understand viewer behavior and improve content recommendations. It collects and analyzes data such as watch time, viewing history, completion rates, and user preferences. Key KPIs include subscriber growth, customer retention, average watch duration, and content engagement. These insights help Netflix decide which movies and series to produce, license, or recommend to users. By using BI effectively, Netflix enhances customer satisfaction and reduces subscriber churn.

Case Study 2: Amazon (E-commerce Industry)

Amazon relies heavily on Business Intelligence for inventory management, pricing strategies, and personalized recommendations. It tracks KPIs such as sales revenue, conversion rate, average order value, inventory turnover, and customer satisfaction. BI enables Amazon to predict product demand, optimize warehouse operations, and recommend products based on customer behavior. These data-driven decisions improve operational efficiency and enhance the shopping experience.

Case Study 3: Starbucks (Retail & Food Industry)

Starbucks uses Business Intelligence to determine store locations, manage inventory, and understand customer purchasing patterns. The company analyzes transaction data, loyalty program activity, and regional demand trends. Important KPIs include daily sales, customer footfall, average transaction value, and loyalty program engagement. These insights help Starbucks decide where to open new stores, what products to promote, and how to optimize staffing and inventory levels.
